

Proxima Health — August Monthly Analytics Report

proxima.health | August 1–31, 2026

Site: proxima.health | **Period:** August 1–31, 2026 (full month) | **Source:** Vercel Web Analytics

August broke every record on the books, and this time the growth is human. July’s report called itself the first true baseline month after the June bot wave, and set August up as the first like-for-like month-over-month comparison. That comparison happened, and it is strongly positive: the 24 clean days from August 8 onward ran at **62 pageviews per day, roughly 70% ahead of July’s clean window (37/day)**. But the headline is two other days. **On August 4–5 a post on X (Twitter) sent about 1,500 visitors to the homepage in 48 hours**, producing 3,811 pageviews (two-thirds of the month), 142 quiz starts, 40 diagnostic signups, and 10 practitioner inquiries. Unlike June’s inflated numbers, every signal says these were real people: 74% on phones, converting through the quiz at the same rate as organic visitors, spread across 88 countries with a normal US majority. August finished at **5,720 pageviews and 2,794 visitors, 4.7x July on both counts.**

Summary

Total Pageviews	Unique Visitors	Pages / Visitor	Bounce Rate
5,720	2,794	2.0	58%

Month-over-month

Month	Days	Pageviews	Visitors	PV / day	Bounce
April (active days)	24	1,509	591	63	71%
May	31	1,047	475	34	63%
June	30	1,121	420	37	54%
July	31	1,224	590	39	60%
August	31	5,720	2,794	185	58%
<i>August, clean window only (Aug 8– 31)</i>	24	1,494	738	62	60%

The full-month figures are dominated by the X spike, so the last row is the one to use for trend. Comparing the clean windows directly, August 8–31 (1,494 pv, 738 visitors over 24 days) against July 9–31 (843 pv, 434 visitors over 23 days, per the API):

pageviews per day rose 70% and visitors per day rose 63%.

Even setting aside August 19 (a LinkedIn-driven 202-pv day, covered below), the underlying run rate was ~56 pv/day, still more than 50% ahead of July.

Three comparability notes:

- **Bounce rate is stable across all three views** — 58% for the month, 57% during the spike, 60% in the clean window, against 60% in July. The X audience did not bounce more than organic visitors, which is unusual for social traffic and the strongest single indicator that the post landed with an interested audience.
- **Pages per visitor dipped 2.1 → 2.0** because 1,480 X visitors landed on the homepage and most read one or two pages. In the clean window it was 2.0 as well; the site's engagement depth has been steady at ~2 pages since the bot-era numbers washed out.

- **The June and July reports counted the /waitlist → /quiz rename** (June 29) by combining paths. August is the first month that needs no combining; /quiz is the only quiz path.

The August 4–5 spike

Window	Pageviews	Visitors	Bounce	From t.co (X)	Quiz starts	Diag. signups	Practitioner inquiries
Aug 1–3 (before)	55	24	50%	0	1	0	0
Aug 4–5 (spike)	3,811	1,842	57%	1,454 pv / 1,388 visitors	142	40	10
Aug 6–31 (after)	1,854	928	61%	106 pv / 92 visitors	24	12	18

- **The spike arrived on Tuesday, August 4 and was gone by Friday.** Referrals from t.co (X's link shortener) went 820 → 634 → 45 → 13 → 11 pv across August 4–8, and 1,525 of the month's 1,560 t.co pageviews landed on the homepage. X's in-app browser was the single most-used "browser" of the month (1,731 pv, 997 visitors). Note that the true X share is larger than the t.co line: once an X visitor clicks to a second page, that pageview records no external referrer, so most of the spike's "direct" traffic is the same audience continuing to browse.
- **August 19 (202 pv, 89 visitors, 31% bounce) was a LinkedIn day.** 26 referrals from linkedin.com and the LinkedIn Android app, 16 from Google, and /about drew 56 pageviews — people came to see who is behind Proxima. It was the lowest-bounce

day of the month by a wide margin. Two visitors also tried / careers and /jobs that day.

- **August 24 (102 pv) and August 28 (111 pv)** were smaller bumps: August 24 was Instagram (6 referrals) plus one visitor from the UAE who read 25 pages; August 28 was the month's best Google day (21 referred pageviews) plus what looks like a practitioner group working through the site (18 pv on / practitioners, 3 inquiries).
- **The clean-window baseline is materially higher than July's.** After the spike tail faded, no day dropped below 15 pageviews (Sunday, Aug 23) and 13 days topped 50 pv; July's clean window had three such days.

Top Pages

Page	Pageviews	% of Total	Visitors	Bounce Rate* (month)	Bounce Rate* (Aug 6–31)
/ (Homepage)	2,928	51%	2,439	56%	56%
/interventions	575	10%	464	15%	35%
/practitioners	555	10%	448	9%	21%
/about	513	9%	440	11%	18%
/diagnostics	502	9%	409	13%	26%
/quiz	322	6%	274	5%	12%
/science	274	5%	232	10%	18%
/privacy	25	<1%	24	—	—
/terms	17	<1%	17	—	—
/physicianagreement	0	—	0	—	—
Other (PDF booklet, guessed URLs)	9	<1%	9	—	—

**Per-page bounce on the v2 methodology, comparable to the June and July reports. The Aug 6–31 column strips out the spike and is the fairer comparison to July.*

Key observations

- **Every content page set a record, and the mix changed.** The X audience did not just read the homepage: /practitioners (372 spike pageviews), /interventions (383), /diagnostics (297), /about (270), and /quiz (254) all drew hundreds of views in 48 hours. /practitioners went from 105 pageviews in July to 555 in August, the largest relative gain of any page — a consumer audience wanted to know how to get treated.
- **Homepage bounce held at 56%, identical to July, under 4x the load.** The homepage did its job during the spike: 44% of a cold social audience clicked through.
- **Per-page bounce on the inner pages rose in the clean window** (e.g. /diagnostics 13% for the month but 26% for Aug 6–31, vs. 34% in July). The spike pulled the monthly figures down because X visitors who reached an inner page had already committed to browsing. The clean-window numbers are all still better than July's, so this is improvement, not regression.
- **/diagnostics fell to fifth place by pageviews (502) after leading the content pages in July (238).** In absolute terms it more than doubled; it simply grew slower than the pages the social audience wanted (/practitioners, /interventions). In the clean window it was neck-and-neck with /interventions and /about at ~150–200 pv each.
- **/physicianagreement recorded zero views (10 in July), and JotForm referrals fell 12 → 5.** The practitioner-onboarding paperwork traffic visible in July went quiet in August, even as inquiry volume tripled. Worth checking on your side whether the July cohort completed onboarding.
- **The blog recorded zero pageviews again** — it remains unlisted (no navigation link, no sitemap), so this is by design. Seven more posts shipped during August (lead, cadmium, n-hexane, asbestos, PFAS x2, phthalates), bringing the standing library to roughly 70 posts waiting for the listing decision.
- **Six visitors guessed URLs that do not exist:** /contact, /contact-us, /careers, /jobs, /team, /diagnostics-guide (one hit each). Small, but it is the first month people have gone looking for a contact page and a jobs page.

Traffic Sources

Referrer	Pageviews	% of Total
Direct / No referrer	3,799	66%
t.co (X / Twitter)	1,560	27%
google.com	214	4%
LinkedIn (linkedin.com, Android app)	50	1%
l.instagram.com	19	<1%
duckduckgo.com	19	<1%
longjourney.vc	14	<1%
bing.com	10	<1%
Facebook (facebook.com, m.facebook.com)	9	<1%
JotForm (form.jotform.com)	5	<1%
Salesforce / corporate instances (Stripe x2, Ramp)	5	<1%
search.yahoo.com	5	<1%
Gmail app (com.google.android.gm)	3	<1%
PitchBook (rts.pitchbook.com)	2	<1%
Other (chatgpt.com, Brave, HubSpot preview, misc)	6	<1%

Key observations

- **X was the story: 1,560 pageviews from 1,480 unique visitors, 98% landing on the homepage, 93% of it on August 4–5.** In July, t.co sent exactly one pageview. This is the first time a social channel has driven meaningful traffic to proxima.health, and it outperformed every other channel's monthly total combined. X-referred traffic bounced at 57%, essentially the site average.
- **Google kept compounding underneath the spike: 214 pv from 178 visitors, up 28% from July's 167 / 142, at a 42% bounce.** In the clean window Google sent 159 pageviews in 24 days, a 23% higher daily rate than July. Search remains the

steady, non-spiky growth engine; the social spike did not cannibalize it.

- **LinkedIn went from 2 pageviews to 50**, almost all on August 19. It brought the most engaged visitors of the month (31% bounce that day, heavy /about traffic). A LinkedIn post is a repeatable, controllable version of what X did by accident.
- **longjourney.vc is now a five-month streak** (13 → 15 → 24 → 14 pv). Fourteen separate visitors in August, spread across 13 different days. Same read as July: a fund that keeps coming back.
- **The fintech cluster returned.** Stripe appeared twice, from its Salesforce instance and from an internal admin domain (admin.corp.stripe.com); Ramp's Salesforce sent two more. New this month: **rts.pitchbook.com (PitchBook's research tool, 2 visits)** and **chatgpt.com (1 visit)**, the first time an AI assistant has sent a visitor. Rillet did not return.
- **Direct fell to 66% of pageviews for the month** (81% in July), but as noted above much of that shift is X visitors browsing past the landing page. In the clean window direct was ~79%, essentially unchanged from July.
- **One visit from preview.hubspoteditor.com** is your own HubSpot email preview — someone was testing an email template that links to the site.

Geographic Breakdown

Country	Pageviews	Visitors	% of PV
United States	3,732	1,808	65%
United Kingdom	284	129	5%
Canada	215	105	4%
Brazil	174	107	3%
Spain	93	36	2%
Switzerland	81	31	1%
Australia	80	43	1%
Germany	77	37	1%
Mexico	72	34	1%
India	64	32	1%

Country	Pageviews	Visitors	% of PV
Turkey	52	27	1%
France	47	25	1%
Other (76 countries)	749	380	13%

Key observations

- **US share held at 65% of pageviews and 65% of visitors (1,808 of 2,794) through a global social spike.** The X post reached an international audience — 88 countries recorded a visit, up from ~46 in July — but two-thirds of it was American. During the spike itself the US accounted for 1,180 of 1,842 visitors (64%); in the clean window, 68%, exactly July's figure.
- **Brazil appeared from nowhere with 107 visitors**, the fourth-largest audience of the month, alongside Spain (36), Mexico (34) and Turkey (27). These are new-to-Proxima audiences that came with the X post; 70 of the Brazilian visitors arrived on August 4–5. Whether any of them are addressable depends on where Proxima intends to treat patients.
- **The German crawler signature from June and July is gone.** Germany fell to 77 pv from 37 visitors (2.1 pages each, a human ratio) versus 87 pv from 25 visitors in July. Austria dropped out of the top list entirely.
- **China: 36 visitors at exactly one page each**, the same indexing-crawler pattern as July (14). Not an audience; discount it.
- **UK visitors quadrupled (33 → 129) and Canada rose nearly sixfold (18 → 105)**, in line with the overall growth, so their share is roughly unchanged. The UK remains the #2 human audience.

Device & Technology

Device Type

Type	Pageviews	%
Mobile	3,768	66%
Desktop	1,880	33%
Tablet	54	1%

Browser

Browser	Pageviews	%
X / Twitter in-app browser	1,731	30%
Chrome (Desktop)	1,390	24%
Mobile Safari	978	17%
Chrome Mobile (Android)	667	12%
Safari (Desktop)	297	5%
Chrome Mobile iOS	213	4%
Microsoft Edge	154	3%
Firefox (all platforms)	69	1%
Brave	66	1%
Other in-app (Instagram, Google, Facebook, WebView)	51	1%
Samsung Browser	47	1%
Opera	33	1%
Other / unknown	24	<1%

Operating System

OS	Pageviews	%
iOS	3,059	53%
macOS	1,103	19%
Android	763	13%
Windows	734	13%
GNU/Linux	43	<1%

- **Mobile went from 25% of pageviews in July to 66% in August.** The spike was 74% mobile (X is a phone product), but the shift outlasted it: **mobile was 49% of pageviews in Aug 6–31 and 45% in the Aug 8–31 clean window**, nearly double July's share. Proxima's audience is now roughly half phone users, and the quiz and forms should be judged on that basis.

- **iOS alone was 53% of all pageviews** (3,059, vs. 272 in July) and 41% even in the post-spike window. iPhone is the primary device for the consumer audience the X post reached.
- **Windows fell to 13% (17% in July)** by share, though it grew in absolute terms (734 pv vs. 209). The practitioner/desktop segment is intact; it was simply outgrown by consumers on phones.
- **GNU/Linux at 43 pv from ~30 visitors** is the residual crawler bucket, down from 55 in July. Nothing to act on.

Custom Event Tracking

Event	Count	Unique Visitors

quiz_question_back	22	17
quiz_why_we_ask_opened	11	7

Practitioner inquiries: tripled, still clean

Window	Submissions	Pattern
June 1–22 (pre-wave)	8	~1 every 2–3 days
June 23–30 (bot wave)	51	Daily flood, 14 on the worst day

Window	Submissions	Pattern
July 1–31 (post-mitigation)	9	~1 every 3 days, organic cadence
August 4–5 (X spike)	10	5 per day, both days
August 6–31	18	~1 every 1.4 days, never more than 3 in a day

Twenty-eight submissions in August, up from nine in July, and none of them look like the June flood. They arrived on 16 separate days (Aug 4, 5, 6, 7, 8, 9, 10, 11, 12, 15, 22, 24, 25, 28, 30, 31), with the only multi-submission days being the two spike days (5 each), August 7 and 24 (2 each) and August 28 (3). The June wave, by contrast, ran 14 in a day with no matching traffic. The honeypot and reCAPTCHA held through the highest-traffic week the site has had.

Two caveats for working these leads. First, **the ten spike-day inquiries came from a consumer-facing X audience** and may include prospective patients using the practitioner form because it was the only “talk to someone” path they found; an eyeball check of those ten HubSpot contacts for practice type is worth two minutes. Second, the 18 post-spike inquiries represent a doubling of the organic practitioner-inquiry rate versus July, in line with the doubling of clean-window traffic — a genuine step up in the pipeline.

Funnel Analysis: Diagnostic Quiz (full month)

Stage	Unique Visitors	Rate
Quiz started	167	—
Quiz completed	135	81% complete
Email submitted	60	44% of completers
Email skipped	59	44% of completers
Diagnostic signup	52	31% of starters

For comparison, the same funnel by window:

Window	Started	Completed	Email submitted	Diagnostic signup	Signups / starter
July (full month)	9	7	5	5	56%
Aug 4–5 (X spike)	142	112	50	40	28%
Aug 8–31 (clean window)	19	17	7	8	42%

- **The quiz just processed 18x July's monthly volume without breaking.** 142 starts in 48 hours, 79% completion, 40 diagnostic signups from a cold audience. July's report said the quiz "converts over half its starters" but "gets almost no feed"; August proved the first half at scale. The signup-per-starter rate fell from 56% to 28% under social traffic, which is expected — a cold X audience is less committed than a visitor who navigated to the quiz deliberately — and 28% of a cold social audience is still a very good number.
- **Email capture is the weak stage: 60 submitted vs. 59 skipped,** and 16 completers did neither (closed the tab at the email step). July ran 71% submit / 29% skip on tiny numbers; at volume it is a coin flip. The email screen is now the single highest-leverage screen on the site, because it gates whether 135 completed assessments become 135 contacts or 60.
- **The clean-window feed improved but is still thin.** 19 starts from 118 /diagnostics visitors (Aug 8–31) versus 9 from 183 in July — a better ratio, but /diagnostics still has no quiz link (the only quiz entry points are three homepage links and the footer). The homepage → diagnostics → quiz routing experiment recommended since May did not ship in August; only blog posts did.
- **CTA clicks: 192 for the month, 172 of them during the spike.** In the clean window CTA clicks were 13, identical to July's clean window (13). The homepage CTA rate has not moved because the homepage CTA has not changed.
- **research_link_clicked: 47 fires from 16 visitors,** with 33 of them from 7 people after August 8. A small group went deep into the science references.

- **quiz_why_we_ask_opened (11 fires, 7 visitors)** is back in the table after not registering in July — a tooltip on the quiz that only shows up at volume. Harmless, listed for completeness.

Follow-up on July's recommendations

1. **Fix the quiz feed (homepage / diagnostics CTA experiment).**
Not shipped; August's commits were blog posts only, and / diagnostics still carries no quiz link. The August data makes the case louder rather than quieter: the quiz handled 142 starts in two days and converted 28% of a cold audience into diagnostic signups. It is not a capacity or quality problem. It is a routing problem, now four months running.
2. **Decide when to list the blog.** Still unlisted, still zero views, still growing (seven posts in August). Google referrals rose 28% anyway on the core pages, so the domain's search standing is not waiting on the blog. The decision remains open.
3. **Call Long Journey.** Fifth consecutive month, 14 visitors, 13 separate days.
4. **Track the fintech cluster.** Stripe and Ramp both returned; PitchBook joined. Whatever is circulating is still circulating.
5. **Close out the HubSpot purge.** No visibility from the analytics side on whether the June 23–July 8 junk contacts were purged. If they were not, do it before working the August batch: the 37 clean post-mitigation inquiries from July and August are now the working pipeline, and the June 23–July 8 cut is unambiguous.
6. **Stand down on bot work.** Confirmed. The site absorbed 1,842 visitors in two days with no form flood, no crawler geos, and a normal device mix. The German and Austrian crawl signatures have cleared.
7. **August vs. July as the first like-for-like comparison.**
Delivered, with an asterisk: the clean-window comparison (Aug 8–31 vs. July 9–31) shows +70% pageviews per day and +63% visitors per day. The full-month comparison is dominated by the spike and should not be used for trend.

Recommendations for September

1. **Find the August 4 post and do it again.** One X post produced more visitors in 48 hours than the site had seen in any prior month, and it converted. Identify the account and the post, thank or engage the author, and build a repeatable social

cadence around the same angle. Add UTM parameters to any owned social links so the next spike is attributable to a specific post rather than to “t.co”.

2. **Ship the quiz routing experiment.** Add a quiz CTA to /diagnostics and point the homepage primary CTA at the diagnostics → quiz path. This is the fourth month of recommending it, and August removed the last excuse: the quiz demonstrably converts at scale.
3. **Fix the quiz email screen.** At volume, half of completers skip the email step and a further 12% abandon there. Test a shorter ask, a clearer “what you get” line, or moving the email capture before the results screen. This is the cheapest way to double the contact yield from the same traffic.
4. **Design for mobile first.** Mobile is now 45–66% of pageviews depending on the window, and iOS alone was 53% in August. Walk the homepage → /diagnostics → quiz → email path on an iPhone and fix anything that is not effortless.
5. **Give consumers their own door.** The X audience used the practitioner form because it was the only contact path. A patient-facing “join the waitlist / find a practitioner” entry on /practitioners (or a /contact page, which six visitors went looking for in August) keeps the practitioner pipeline clean and captures consumer demand rather than losing it.
6. **Repeat the LinkedIn post monthly.** August 19 brought 89 visitors at 31% bounce, the most engaged day of the month, and it is fully under Proxima’s control.
7. **Check the practitioner-onboarding pipeline.** /physicianagreement went from 10 views to zero and JotForm referrals fell 12 → 5, while inquiries tripled. If the July cohort stalled in the paperwork, it will show up on your side before it shows up here.
8. **Keep the search engine running.** Google referrals are compounding at 20–30% a month regardless of everything else. The blog listing decision, and a Google Search Console pull to see which queries are landing on the core pages, are the two levers.
