

Proxima Health — June Monthly Analytics Report

proxima.health | June 1–30, 2026

Site: proxima.health | **Period:** June 1–30, 2026 (full month) |
Source: Vercel Web Analytics

Data quality note — read this first. From roughly **June 23 onward, automated bot traffic hit the site’s forms**, inflating late-June pageviews, form-submission events, and several geographic figures. You saw this on your side as junk practitioner inquiries in HubSpot. Countermeasures shipped in two rounds (reCAPTCHA on the practitioner form June 29; honeypot fields on all forms plus a stricter reCAPTCHA threshold July 8). Where a June number is bot-contaminated, this report says so and gives the cleaner underlying figure.

Summary

Total Pageviews	Unique Visitors	Pages / Visitor	Bounce Rate
1,121	420	2.7	54%

Month-over-month

Month	Days	Pageviews	Visitors	PV / day	Bounce
April (active days)	24	1,509	591	63	71%
May	31	1,047	475	34	63%

Month	Days	Pageviews	Visitors	PV / day	Bounce
June	30	1,121	420	37	54%

On paper, pageviews rose 7% while visitors fell 12%. In practice, **the June 23–30 bot wave accounts for much of the pageview gain**: that 8-day window alone produced 531 pageviews (47% of the month). The cleaner read is the first three weeks — June 1–22 ran at ~27 pv/day, a modest step down from May's 34, on fewer but slightly more engaged visitors.

Two notes on comparability:

- **Bounce rate methodology changed this month.** Vercel migrated its analytics API (v1 → v2) between the May and June reports, and bounce figures are computed differently. June's 54% is not directly comparable to May's 63% — treat June as the new baseline rather than as an 9-point improvement.
- **June 21 recorded zero pageviews.** Either a genuinely dead Sunday (adjacent days were the month's quietest) or a brief tracking gap. Noted for transparency; it does not materially change any figure.

Daily Traffic

Date	Pageviews	Unique Visitors

Fri, Jun 26	21	12
Sat, Jun 27	30	8
Sun, Jun 28	51	19
Mon, Jun 29	80	25
Tue, Jun 30	104	34
Total	1,121	—

- **June 1–22 is the honest baseline: ~27 pv/day.** Weekday/ weekend rhythm from April and May held — Tue was consistently the strongest day (Jun 2: 92, Jun 16: 48), Sundays the weakest.
- **June 23 is where the bot wave starts** (107 pv, and 14 practitioner-form submissions on that day alone — see Events below). Elevated traffic ran through month-end. Some of the late-June volume is also legitimate: the June 29 integration QA round and its verification testing fall inside this window.
- **The mid-month bump (Jun 15–17: 43/48/29 pv on the month's best visitor counts)** looks organic — real visitors,

normal engagement, no form-spam signature. Likely the May report send and follow-on sharing.

Top Pages

Page	Pageviews	% of Total	Visitors	Bounce Rate*
/ (Homepage)	335	30%	245	47%
/diagnostics	130	12%	91	12%
/practitioners	119	11%	94	13%
/interventions	117	10%	91	14%
/science	104	9%	81	14%
/about	101	9%	85	25%
/quiz (incl. former / waitlist)	97	9%	69	~4%
/terms	59	5%	50	18%
/careers	11	1%	11	—
/privacy	11	1%	10	—
/blog (+ 3 post pages)	10	1%	7	—
Other (contact, press, misc)	~27	2%	~25	—

**Per-page bounce uses the new v2 methodology and is not comparable to the May report's per-page figures. /waitlist was renamed to /quiz on June 29; the row above combines both URLs.*

Key observations

- **Traffic spread out.** The homepage's share fell from 42% to 30%, and the four core content pages (/diagnostics, /practitioners, /interventions, /science) are now tightly clustered at 9–12% each. Visitors who arrive are exploring the full site rather than bouncing off the front door. (Bots also crawl multiple pages, so late-June depth is somewhat inflated — but the pattern holds in the clean June 1–22 window too.)
- **/diagnostics moved up to the #1 content page** (130 pv, was #4 in May). The diagnostics offering is drawing the most interest

of any product page — useful signal for where to point homepage CTAs.

- **/terms at 59 pv (up from 10) is a bot artifact.** Automated crawlers routinely hit terms/privacy pages; discount this row.
- **/blog finally has a pulse (10 pv, first individual post views).** Tiny, but it is the first month any blog post recorded organic views (hexavalent chromium and nickel exposure posts). Six more posts shipped between mid-June and early July; this is the number to watch in July.
- **First blog-driven visit from a newsletter:** one visit arrived via lennysnewsletter.com — worth knowing where the mention was.

Traffic Sources

Referrer	Pageviews	% of Total
Direct / No referrer	977	87%
google.com	89	8%
longjourney.vc	15	1%
linkedin.com	8	1%
bing.com	5	<1%
search.brave.com	4	<1%
l.instagram.com	3	<1%
Other search (DuckDuckGo, Ecosia, Yahoo)	5	<1%
facebook.com / t.co	4	<1%
app.tryspecter.com	1	<1%
rampfinancial.lightning.force.com	1	<1%
Other (react19.org, mail, misc)	~9	1%

Key observations

- **Direct at 87% — inflated by bots this month.** Bot traffic carries no referrer, so it lands in this bucket. The underlying person-to-person distribution pattern is unchanged, but do not read the 2-point rise from May as a trend.

- **Google slipped to 89 pv but the visits got better.** Google-referred bounce came in at 41% under the new methodology — searchers are sticking around rather than pogo-ing back to results. With the blog now indexed and 6 new posts live, July is the month organic search should start compounding.
- **longjourney.vc is now a three-month streak** (13 pv → 15 pv). A VC fund persistently sending traffic for a quarter is no longer noise. If a conversation isn't already underway, start one.
- **Two B2B/finance tools appeared:** app.tryspecter.com (startup-intelligence platform used by investors) and a Salesforce instance at rampfinancial.lightning.force.com. Someone is evaluating Proxima inside professional deal-flow tooling.
- **Search is diversifying:** Brave, Ecosia, DuckDuckGo, and Yahoo all sent first or repeat visits. Small, but consistent with growing index coverage.

Geographic Breakdown

Country	Pageviews	Visitors	% of PV
United States	624	249	56%
Germany	118	23	11%
Sweden	66	17	6%
Canada	39	11	3%
Switzerland	26	7	2%
Luxembourg	25	4	2%
United Kingdom	24	16	2%
Denmark	21	7	2%
Norway	20	5	2%
India	18	10	2%
Malaysia	13	1	1%
Other (~40 countries)	~127	~70	11%

Key observations

- **US share dipped to 56% (from 73%) — mostly bot distortion.** Germany (118 pv from just 23 visitors, 5.1 pages

each), Sweden, Luxembourg, and Malaysia (13 pv from a single visitor) all show the deep-crawl, few-visitors signature of datacenter traffic. Expect the US share to snap back toward ~70% in July now that mitigations are live.

- **By visitor count, the picture is normal:** US 249, Germany 23, Sweden 17, UK 16 — the genuine audience remains overwhelmingly North American with a UK/EU fringe.
- **Canada recovered slightly** (11 visitors, up from May’s soft showing) without any active seeding.

Device & Technology

Device Type

Type	Pageviews	%
Desktop	877	82%
Mobile	188	18%

Browser

Browser	Pageviews	%
Chrome (Desktop)	785	70%
Mobile Safari	105	9%
Microsoft Edge	45	4%
Chrome Mobile iOS	42	4%
Chrome Mobile (Android)	31	3%
Safari (Desktop)	28	2%
Firefox	20	2%
In-app (Instagram, Facebook, Google)	8	1%

Operating System

OS	Pageviews	%
macOS	691	62%
Windows	164	15%
iOS	156	14%

OS	Pageviews	%
Android	32	3%
Linux / Chrome OS	22	2%

- **Desktop Chrome + macOS both jumped — partly bots**
(headless crawlers typically present as desktop Chrome on Mac/Linux). The clean-window pattern still matches prior months: a desktop-first, Apple-heavy research audience.
- **Windows share halved (23% → 15%).** Worth re-checking in July's clean data before reading anything into the practitioner segment.

Custom Event Tracking

Event	Count	Unique Visitors
quiz_question_answered	247	14
scroll_depth	225	49
nav_clicked	206	93
footer_link_clicked	71	49
practitioner_inquiry_submitted	59*	50*
quiz_started	26	15
quiz_completed	24	14
quiz_email_submitted	20	11
cta_clicked	19	11
research_link_clicked	10	2
quiz_why_we_ask_opened	10	1
diagnostics_signup_submitted	9	5
quiz_email_skipped	2	2
quiz_question_back	2	2

**Heavily bot-contaminated — see breakdown below.*

Practitioner inquiries: separating real from bot

Daily submission counts tell the story cleanly:

Window	Submissions	Pattern
June 1–22	8	~1 every 2–3 days, matching April/May cadence
June 23–30	51	14 on June 23 alone; sustained daily flood

The honest June practitioner-lead count is ~8–12 (the 8 pre-wave submissions, plus whatever fraction of the late-June flood was real — the June 29 QA testing also fired this event). The 51-submission spike is the HubSpot junk you flagged. reCAPTCHA went live on the form June 29; because submissions continued, the July 8 round added honeypot fields to all forms and raised the reCAPTCHA score threshold to 0.7. **July’s first clean week will confirm whether the wave is fully stopped — we are monitoring it.**

Recommended cleanup: purge HubSpot contacts created by the practitioner form between June 23 and July 8 that fail an eyeball test (gibberish names, disposable email domains), so the CRM funnel stats stay trustworthy.

Funnel Analysis: Diagnostic Quiz (full month)

Stage	Unique Visitors	Rate
Quiz started	15	—
Quiz completed	14	93% complete
Email submitted	11	79% of completers
Email skipped	2	14% of completers
Diagnostic signup	5	33% of starters

- **The quiz funnel had its best month yet.** Completion hit 93% (from 81%), and email capture jumped to 79% of completers (from 46%). Nearly everyone who starts the quiz now finishes it and leaves an email.
- **Diagnostic signups: 5 unique visitors (9 submissions), up from 2.** Small numbers, but the diagnostics funnel more than doubled — consistent with /diagnostics becoming the #1 content page.
- **Starts remain the bottleneck: 15 unique starters** against ~370 genuine visitors is a ~4% start rate (better than May’s

~1.5%, helped by the /quiz rename and cleaner entry point — but still the constraint).

- **CTA clicks: 19 (1.7% of pageviews), up from 1.4%.** Modest improvement; the homepage CTA test recommended in May remains open.
- **research_link_clicked collapsed to 10 fires from just 2 visitors** (was 23 from 10). The evidence-seeking behavior concentrated in fewer, deeper sessions this month.

Recommendations for July

1. **Confirm the bot wave is dead.** The honeypot + stricter reCAPTCHA shipped July 8. Watch practitioner_inquiry_submitted daily for the first two July weeks; if any flood recurs, the next step is edge-level bot filtering (Vercel BotID / firewall rules) rather than more form-level checks.
 2. **Purge June 23–July 8 junk contacts from HubSpot** so CRM conversion metrics stay meaningful. We can supply the exact submission timestamps if useful.
 3. **Feed the quiz.** The funnel now converts excellently (93% completion, 79% email capture) — every additional start is worth real pipeline. Promote the /quiz URL directly in outreach and social; it is short, shareable, and no longer buried behind a waitlist framing.
 4. **Ride the blog's first signs of life.** First organic post views arrived exactly on the 4–8 week indexing schedule predicted in May. Keep the posting cadence, and pull Google Search Console this month to see which queries are landing.
 5. **Call Long Journey.** Three consecutive months of referral traffic from longjourney.vc, now joined by visits from investor-intelligence tooling (Specter, a Salesforce instance). Proxima is being evaluated; be proactive.
 6. **Lead with diagnostics.** /diagnostics is now the top content page and diagnostic signups doubled. Point the homepage primary CTA at the diagnostics → quiz path and re-test.
 7. **Treat June as the new analytics baseline.** The v2 measurement change plus the bot noise make May-to-June comparisons soft. July vs. June (clean weeks) will be the first true like-for-like read.
