

Proxima Health — Integration

QA Follow-Up: Confirmation

Practitioner form mapping · Waitlist UTMs · CAPTCHA · /quiz
rename | Prepared June 29, 2026

All four items from the June 29 QA follow-up are implemented and deployed to production. This document confirms each against the changes shipped. Two items require keys/configuration on the HubSpot and reCAPTCHA side before final QA — flagged below.

Summary

#	Item	Status
1	Practitioner inquiry — field mapping	Shipped
2	Waitlist UTM persistence (diagnostics lightbox)	Shipped
3	CAPTCHA on practitioner form (reCAPTCHA v3)	Shipped — needs keys
—	Housekeeping: rename /waitlist → / quiz	Shipped

1. Practitioner inquiry — field mapping

All seven fields now map to the exact HubSpot internal names specified.

Site form field	HubSpot internal name	Notes
First name	firstname	—
Last name	lastname	—
Email	email	—
Practice / institution	clinic_name	—
Specialty (dropdown)	clinic_specialty2	Corrected — was previously mapped to specialty
Partnership interest (multi-checkbox)	partnership_interest	Now sends internal values (see below)
Additional notes	practitioner_notes	Newly mapped — was not being sent before

Partnership interest now sends your internal checkbox values, semicolon-delimited with no spaces:

Checkbox selected	Value sent
Diagnostics Partnership (offer Proxima Health Baseline to patients)	diagnostic_testing_partnership
Inuspheresis Availability	inuspheresis_loi
Clinical Research Collaboration	general_partnership

Examples: first two selected → diagnostic_testing_partnership;inuspheresis_loi. One selected → that single value. None selected → field left blank. This matches your spec exactly.

One confirmation needed on your side: Specialty is sent as the exact dropdown label shown on the site (Functional Medicine, Integrative Medicine, Internal Medicine, Longevity / Anti-Aging, Naturopathic Medicine, Other). For these to land, the `clinic_specialty2` options in HubSpot must match those labels exactly — otherwise HubSpot silently drops the field. Please confirm the option labels line up, or send us your exact list and we'll align the form.

2. Waitlist UTM persistence (diagnostics lightbox)

Root cause found and fixed. UTM capture on `/diagnostics` was working (params were stored on landing and passed into the lightbox), but the server route that submits the waitlist signup was not forwarding those UTM values on to HubSpot. That forwarding is now in place.

All five UTM fields are now passed end-to-end from the diagnostics page through the lightbox submission: `utm_source`, `utm_medium`, `utm_campaign`, `utm_content`, `utm_term`.

This means the exact test you ran — landing on `proxima.health/diagnostics?`

`utm_source=gatest_real&utm_medium=email&utm_campaign=waitlist_retest`, opening the lightbox, and submitting — will now populate those fields on the HubSpot contact.

3. CAPTCHA on practitioner inquiry form

reCAPTCHA v3 (**invisible, no user friction**) is implemented on the practitioner form only. The quiz and waitlist forms are untouched. The form runs the check silently on submit and the server rejects low-score (likely-bot) submissions before they reach HubSpot or the spreadsheet.

Action required before it's live: This needs a reCAPTCHA v3 site registered in Google (with the production domains) and two keys added to the hosting environment: `NEXT_PUBLIC_RECAPTCHA_SITE_KEY` and `RECAPTCHA_SECRET_KEY`. Until the secret is present the form continues to work normally with no bot filtering, so there is no risk of blocking real

submissions during setup. These keys are being provisioned; CAPTCHA enforcement begins on the next deploy after they are set.

Housekeeping — [/waitlist](#) → [/quiz](#)

The toxin assessment now lives at [/quiz](#). All internal links across the site (homepage, blog posts, science page, footer) were updated, and a permanent redirect from [/waitlist](#) to [/quiz](#) is in place so existing links, bookmarks, and indexed URLs keep working.

What's confirmed for re-QA

- **Item 1:** All 7 practitioner fields map to the correct HubSpot internal names. **Ready to test** (pending your `clinic_specialty2` option-label check).
- **Item 2:** Waitlist UTMs persist end-to-end from the diagnostics page through the lightbox submission. **Ready to test.**
- **Item 3:** CAPTCHA code is live on the practitioner form; **enforcement activates once the reCAPTCHA keys are added to the environment.**

Happy to hop on a call for the final QA pass whenever works.
